Candidature pour IT ENGINEER chez Malt

Madame, Monsieur,

Malt's focus on building a freelance platform that simplifies the way companies and freelancers work together resonates with me, particularly in the context of IT engineering. The company's emphasis on using technology to streamline processes and improve efficiency aligns with my own approach to designing solutions that replace manual work with automated systems. I am drawn to the idea of working with a company that values innovation and is committed to making a positive impact on the way people work.

My experience as an intern at KPIT Technologies and Talan Tunisie has taught me the importance of developing scalable and reliable systems. In my final-year project at KPIT, I had to design an autonomous system that could integrate AI agents and a LLM judge to diagnose defects in web interfaces. This required me to think critically about how to industrialize the pipeline and make it integrate seamlessly with existing workflows. Similarly, at Talan Tunisie, I had to implement platform fundamentals and develop applications on Salesforce, which involved understanding the intricacies of data management and security.

I am interested in the IT Engineer role at Malt because it offers the opportunity to work on-site in Paris and contribute to the development of the company's platform. I am eager to learn more about the company's approach to Okta identity management, Terraform, and device management tools, and how I can apply my skills and experience to make a meaningful contribution. I am ready to relocate to Paris and commit to the role for at least a year, and I am confident that my skills and experience make me a strong candidate for the position.

Veuillez agréer mes salutations distinguées,

Chedy Chaaben
