Application for Developer Advocate (Database) at jetbrains

Dear Hiring Manager,

Developer Advocate (Database) at jetbrains stands at the intersection of deep technical work and community enablement, focused on tools like DataGrip and database ecosystems including PostgreSQL, Oracle, and SQL Server. What sets this role apart is how it centers on written-first, technically precise content that directly supports developers working with relational databases, tools that shape real-world workflows across industries. The emphasis on intelligent software development tools reflects a commitment to reducing cognitive load through clarity and consistency, which aligns with how I approach system design: by building reliable, automated solutions that replace fragmented manual processes.

In my work on ETL pipelines at Perfaxis, I architected data flows in SQL Server 2019 that required not just technical accuracy but clear documentation so teams could trust and reuse them. That experience taught me that robust database development depends on more than code, it depends on shared understanding. Similarly, while designing an AI-driven QA system at KPIT, I orchestrated multi-agent pipelines that processed visual input into structured JSON reports, a project where asynchronous communication and written precision were essential, especially across remote teams. These projects were built to last, not just to demonstrate, and they reflect how I work: by creating systems that are maintainable, explainable, and documented from the start.

I am based in Sfax, Tunisia, where I've developed workflows adapted to fully remote collaboration, relying on async communication and a written-first culture to ensure clarity and continuity. My goal is to join jetbrains as a Developer Advocate (Database) this year, producing technical content that helps others master database tools through real, applicable insight, drawing on hands-on experience with PostgreSQL, Oracle, and SQL Server, and shaped by the needs of developers like me.

Sincerely,

Chedy Chaaben
